For AAI solenoid valve function diagnosis, judge OK or NG by the amount of change of intake manifold pressure when opening and closing the AAI solenoid valve.

**Max. value with the valve open – Min. value with the valve closed < Threshold value → NG**

**Max. value with the valve open – Min. value with the valve closed ≥ Threshold value → OK**

### 1. OUTLINE OF DIAGNOSIS

Detect the slow response of front oxygen (A/F) sensor.

### 4. DIAGNOSTIC METHOD

When the misfire occurred, the engine speed is decreased and the crankshaft position speed will change. Calculate the interval difference value (diagnostic value) from crankshaft position speed, and judge whether the misfire occurs or not comparing the calculated result with judgment value.

Calculate the diagnostic value (from crankshaft position speed)	→ Misfire detection every single ignition (Compare diagnostic value with judgment value) <ul style="list-style-type: none"> <li>• 180° Interval Difference Method</li> <li>• 720° Interval Difference Method</li> <li>• Pattern Recognition Method</li> </ul>	→ NG judgment (Judge misfire occurrence required by the law) (Compare number of misfire with judgment) <ul style="list-style-type: none"> <li>• FTP1.5 times misfire NG judgment</li> <li>• Catalyst damage misfire NG judgment</li> </ul>
-----------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

For misfire detection, there are three methods such as 180° Interval Difference Method, 720° Interval Difference Method and Pattern Recognition Method.

#### • 180° Interval Difference Method, 720° Interval Difference Method

Transform the time needed for crankshaft movement from BTDC65° to BTDC10° into revolution. As the following, regard the revolution as MNX0. And then regard the former revolution as MNX1, the second former revolution as MNX2, and the third as MNX3, etc.

Use the detecting method below for misfire patterns, and judge misfire occurrence when the result calculated from the formula is out of threshold value.

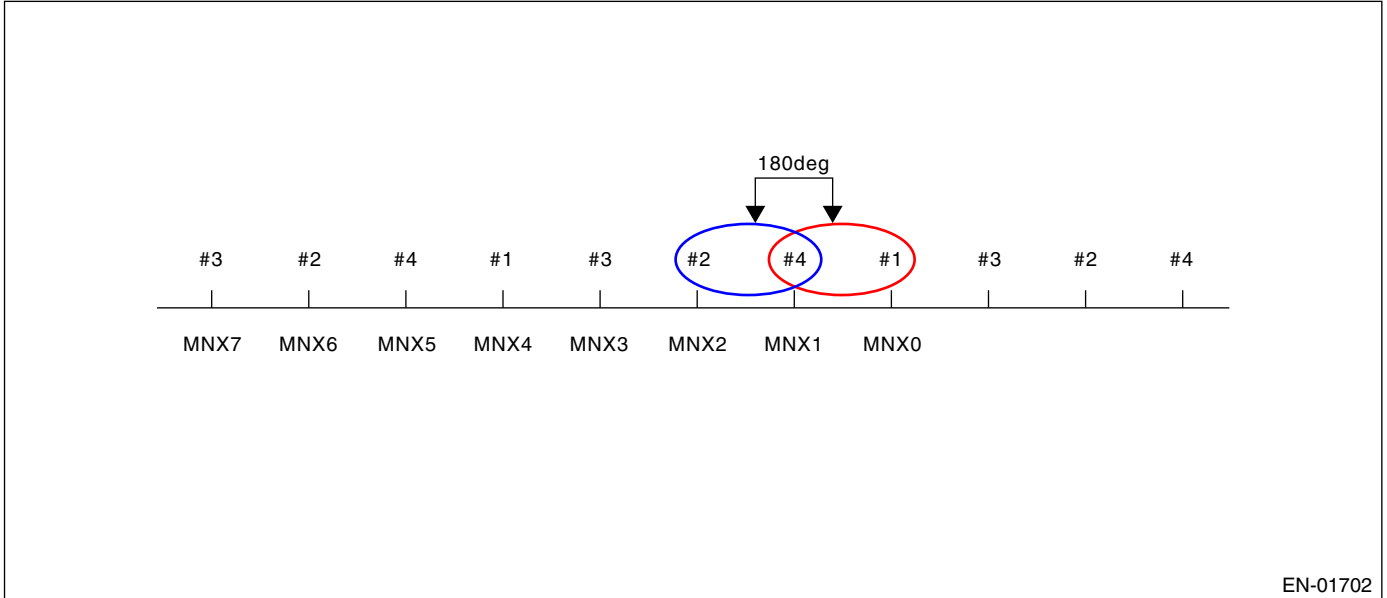

- (A) Ignition order
- (B) Engine speed (rpm)

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

## GENERAL DESCRIPTION

### 180° Interval Difference Method (DDNCON0)

(1)  $DDNCON1 = (MNX\ 1 - MNX\ 2) - (MNX\ 2 - MNX\ 3) \leq \text{Threshold value}$

(2)  $DDNCON0 = (MNX\ 0 - MNX\ 1) - (MNX\ 1 - MNX\ 2) \geq \text{Threshold value}$

Judge misfire when the (1) and (2) above are completed.

### 720° Interval Difference Method (DDNCYL0)

(3)  $DDNCYL4 = (MNX\ 4 - MNX\ 5) - (MNX\ 8 - MNX\ 9) \leq \text{Threshold value}$

(4)  $DDNCYL0 = (MNX\ 0 - MNX\ 1) - (MNX\ 4 - MNX\ 5) \geq \text{Threshold value}$

Judge misfire when the (1) and (2) above are completed.

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

GENERAL DESCRIPTION

## • Pattern Recognition Method

Pattern Recognition Method has two patterns such as every time misfire on one cylinder and continuous misfire on two cylinders.

EN-01705

### Every time misfire on one cylinder

Calculate the simple average (calculate MNX 0 – MNX 1) per one hundred ignitions for one cylinder (per four hundred ignitions for four cylinder).

Regard the value calculated for #1 cylinder as AVE1, #2 cylinder as AVE2, and as AVE3, AVE4 like the same way. Judge misfire occurrence when the value calculated from the following formula is larger than threshold value.

(Max. value of AVE1 to AVE4) – AVE<sub>n</sub> (n=1, 2, 3, 4) ≥ threshold value → Judge that misfire occurs.

### Continuous misfire on two cylinders

(1) Two continuous ignitions with “MNX 0 – MNX 1 ≥ threshold value” occurs.

(2) Two continuous ignitions with “MNX 0 – MNX 1 ≤ – (threshold value)” occurs.

Judge misfire occurrence on continuous two cylinders when the judgment criteria (1) and (2) above repeated for four hundred ignition.

### • FTP 1.5 times Misfire (Misfire occurrence level which influences exhaust gas)

Judge malfunction when the misfire rate in 1000 revs. is large.

#### Judgment Value

Malfunction Criteria	Threshold Value
FTP emission	> 1.0% in 1000 revs.

**Time Needed for Diagnosis:** 1000 engine revs.

**Malfunction Indicator Light Illumination:** Twice continuous driving cycles.

### • Catalyst Damage Misfire (Misfire occurrence level which results in catalyst damage)

Judge malfunction when the misfire rate in 200 revs (400 ignitions) is large.

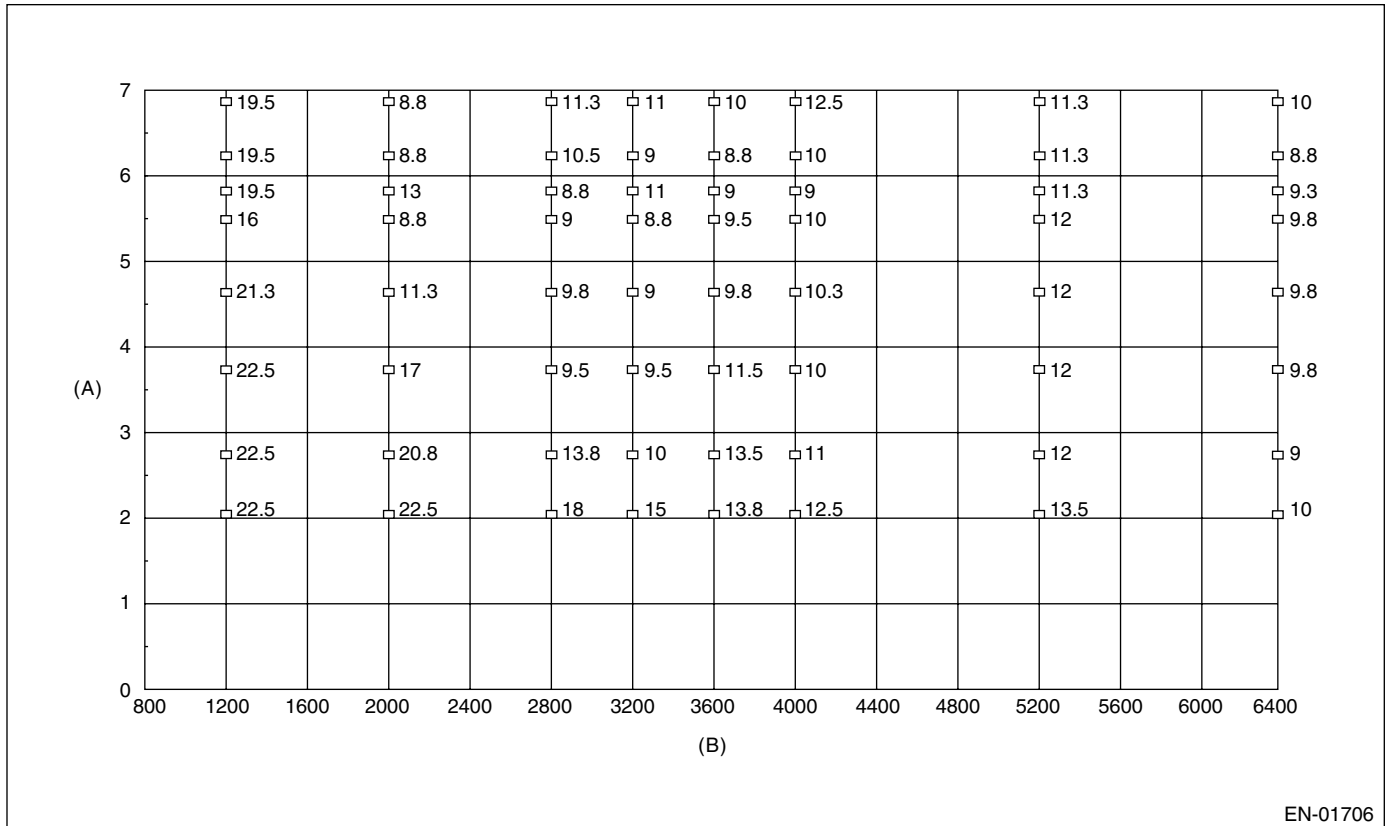

#### Judgment Value

Malfunction Criteria	Threshold Value
Catalyst damage	> See Map 1

## AU:DTC P0420 — CATALYST SYSTEM EFFICIENCY BELOW THRESHOLD (BANK 1) —

### 1. OUTLINE OF DIAGNOSIS

Check the catalyst efficiency deterioration.

Generally, the catalytic converter exhaust gas conversion efficiency and oxygen absorbing/removing function are inter-related. The front A/F sensor and rear oxygen sensor are therefore utilized to monitor the oxygen absorbing/removing function, and the results are used to monitor the conversion efficiency.

- (2) Front catalyst converter
- (3) Rear catalyst converter

- (4) Front oxygen (A/F) sensor
- (5) Rear oxygen sensor
- (6) Diagnosis circuit

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

## GENERAL DESCRIPTION

Oil adherence to the catalytic metal (an alloy of platinum and rhodium, or an alloy of platinum, rhodium and palladium) in catalyst converter or metal melting by extraordinary high temperature result in the decrease of metal surface area contacting exhaust gas. Eventually, catalytic conversion efficiency blunted and oxygen density of catalyst downstream may change.

(B) Deterioration

(C) Oil adherence

(D) Metal melting by high temperature

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

GENERAL DESCRIPTION

Output of rear oxygen sensor changes gradually with a new catalyst, but the blunted catalyst efficiency mentioned above makes sensor output larger and inverse time shorter.

Therefore, catalyst diagnosis is conducted by monitoring the rear oxygen sensor output and comparing its output with the front A/F sensor output.

(B) Rear oxygen sensor output waveform

Judge NG when the malfunction criteria below are completed, and judge OK when they are not completed.

### 2. COMPONENT DESCRIPTION

#### • Pressure Control Solenoid Valve

PCV controls the fuel tank pressure to be equal to the atmospheric air pressure.

Normally, the solenoid is set to OFF. And the valve opens and closes mechanically in accordance with the pressure difference between tank and atmospheric air, or tank and canister.

The valve can be forcibly opened by setting the solenoid to ON at the time of diagnosis.

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

## GENERAL DESCRIPTION

### • Purpose of this solenoid

Fuel tank pressure sensor detects the difference between the atmospheric air pressure and the tank pressure and the ECM monitors the pressure difference.

Even if the tank pressure is constant, the atmospheric air pressure varies depending on the driving height, and the pressure signal transmitted to ECM will change.

- (2) Fuel tank
- (3) Fuel tank pressure sensor
- (4) Atmospheric pressure switching solenoid

EN-01722

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

GENERAL DESCRIPTION

Especially, in the small leakage [0.5 mm (0.02 in)], minute change in the tank pressure has to be detected. This diagnosis period is long (approx. 29 seconds). And if the driving height changes during the diagnosis, the atmospheric air pressure changes. In this case, it becomes difficult to precisely detect the tank pressure variation, causing erroneous diagnosis. Therefore, using the atmospheric pressure switching solenoid, atmospheric air is sealed between the fuel tank pressure sensor and atmospheric pressure switching solenoid, maintaining the air pressure constant and enabling the detection of minute variation of tank pressure.

- (1) Engine control module (ECM)
- (2) Fuel tank
- (3) Fuel tank pressure sensor
- (4) Atmospheric pressure switching solenoid

## NOTE:

ECM also has the atmospheric air pressure sensor, and always monitors atmospheric air. However, as the monitoring range is large, that is, 53 to 107 kPa (400 to 800 mmHg, 16 to 32 inHg) it is not suitable for detection of minute pressure variation.

In the case of small leakage diagnosis, the tank pressure variation is very small, that is, 0.13 to 0.27 kPa (1 to 2 mmHg, 0.04 to 0.08 inHg) and the fuel tank pressure sensor is equipped.

## 5. DIAGNOSTIC METHOD

### • MODE Y (Tank pressure stabilization)

Perform the diagnosis under the conditions, and return the tank pressure to atmosphere.

Tank pressure > 0.9 kPa (67.5 mmHg, 2.7 inHg) after 0.1 seconds:

Cancel the leak check. (Change to Mode A, Tank pressure ≤ 0.9 kPa (67.5 mmHg, 2.7 inHg).)

### • MODE Z (Purge control solenoid valve open malfunction diagnosis, CPC close malfunction diagnosis)

DTC P0457

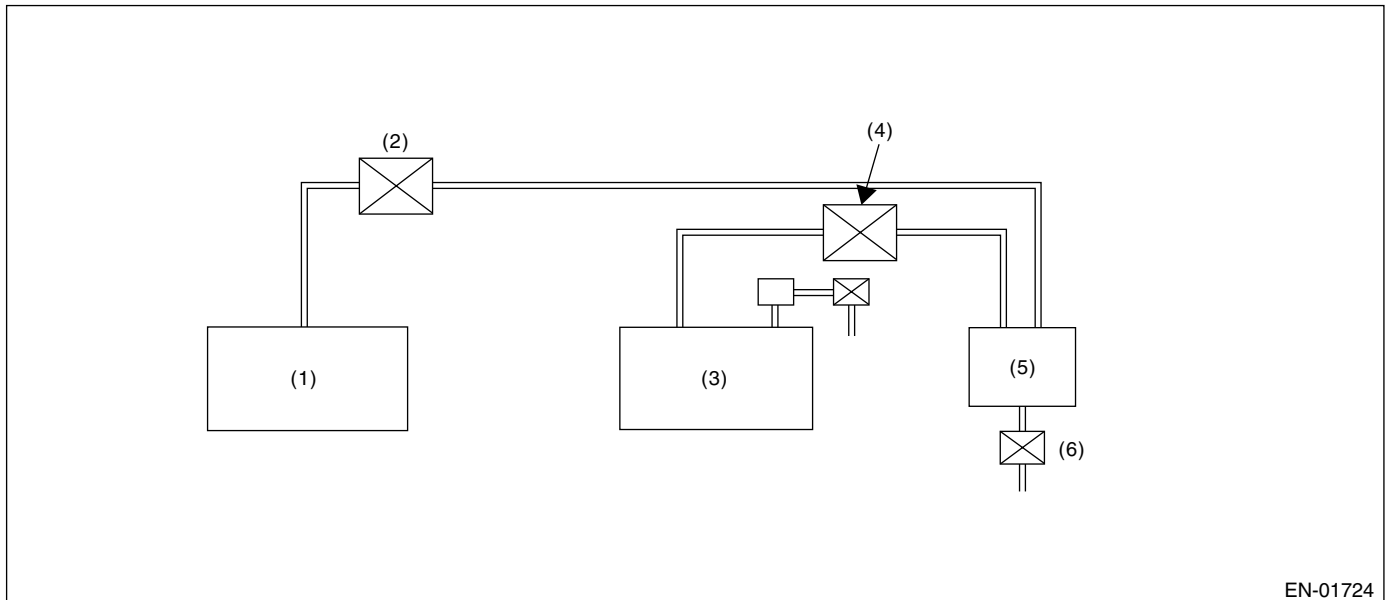

DTC P1443

### • Purpose of Mode Z

When performing the leakage diagnosis of EVAP system, CCV and CPC have to operate normally. Therefore, mode Z is used to diagnose the CCV close fixation and CPC open fixation.

If the CCV closed fixation trouble or CPC open fixation trouble is detected, the EVAP system leakage diagnosis is cancelled.

If the CCV closed fixation trouble occurred, negative pressure is generated from the engine to pressure control solenoid valve when pressure control solenoid valve is closed and CPC is opened. In this case, the valve cannot be opened for the pressure control solenoid valve structure if the negative pressure is larger than electromagnetic force when pressure control solenoid valve solenoid is set to ON in order to open the valve.

### • Leak Diagnosis

DTC P0442

DTC P0456

DTC P0457

### • Diagnostic method

- The diagnostic method consists of creating a sealed vacuum in the fuel tank and then determining the presence of leakage from the speed at which the tank internal pressure returns to atmospheric pressure.
- The diagnosis is divided into the following five phases.

#### Mode A;

Calculate the tank pressure variation amount P1. After calculating P1, change to Mode B.

#### Mode B;

Introduce the negative pressure in the intake manifold to the tank.

Approx. 0 → -1.4 kPa (0 → -10.5 mmHg, 0 → -0.41 inHg) (0.04-in diagnosis)

Approx. 0 → -3.05 kPa (0 → -22.9 mmHg, 0 → -0.9 inHg) (0.02-in diagnosis)

When the pressure above (desired negative pressure) is reached, Mode C is entered.

In this case, if the tank pressure does not become the desired negative pressure, judge that there is a large leakage in the system.

Judge NG when the malfunction criteria below is completed.

Finish the Evap. diagnosis when judging large leak (35 seconds) in 0.04-inch diagnosis. Cancel the diagnosis (62 seconds) in 0.02-inch diagnosis.

### Abnormality Judgment

Judge NG (large leak) when the criteria below are completed in the specified time.

Specified Time

High vehicle speed mode (Vehicle speed ≥ 72 km/h (45 MPH)); 35 seconds

Low vehicle speed mode (Vehicle speed < 72 km/h (45 MPH)); 35 seconds

## Judgment Value

Malfunction Criteria	Threshold Value	DTC
(0.04-inch diagnosis) (Tank pressure when Mode Z started) – (Min. value of tank pressure during Mode B)	< 900 Pa (6.75 mmHg, 0.25 inHg)	P0457

Cancel the diagnosis when the NG judgment does not completed in the specified time.

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

## GENERAL DESCRIPTION

### Mode C;

Stop the introduction of negative pressure. (Wait until the tank pressure returns to the start level of P2 calculation.)

Change to Mode D when the tank pressure returns to the start level of P2 calculation.

Judge immediate OK and change to Mode E when it does not return in spite of spending the specified time.

	Tank pressure when P2 calculation started	Time for immediate OK judgment
0.04-inch diagnosis	-1.3 kPa (-9.75 mmHg, -0.38 inHg)	16 seconds
0.02-inch diagnosis	-3 kPa (-22.5 mmHg, -0.89 inHg)	20 seconds

### Mode D;

Monitor the pressure variation in the tank in Mode D. In this case, the tank pressure increases, that is, the pressure becomes as high as the atmospheric air pressure, because evaporator is generated. However, if any leakage exists, the pressure increases additionally in proportion to this leakage. The pressure variation of this tank is P2.

After calculating P2, perform small leak diagnosis and change to Mode E if normal. Complete Evap. diagnosis if abnormal.

#### • After Diagnosis

Assigning P1 and P2, which are tank variations measured in Mode A and Mode B, to the formula below, judge the small leakage of the system. If the measured judgment value exceeds the threshold value, it is judged to be malfunction.

#### • 0.04-inch Diagnosis

### BV:DTC P0705 — TRANSMISSION RANGE SENSOR CIRCUIT (PRNDL INPUT)

#### 1. OUTLINE OF DIAGNOSIS

Judge NG when the “D” range switch becomes ground short or open circuit.

#### 2. COMPONENT DESCRIPTION

Inhibitor switch ensures the safety at engine start. This switch is installed to the right side of transmission case, and operated by selector lever.

When the selector lever is in the “P” or “N” range, the engine will start because the electric circuit in inhibitor switch is closed and the starter circuit is connected.

When the selector lever is in the “R”, “D”, “3”, “2” or “1” range, the electric circuit in inhibitor switch is open; therefore, the engine cannot be cranked.

In the “R” range, the back-up light will illuminate because the back-up light circuit in the switch is connected. In addition to the functions above, the inhibitor switch has the circuit which detects the selected range position at the present and transmits the range signal to the TCM.

## **BX:DTC P0716 — INPUT/TURBINE SPEED SENSOR CIRCUIT RANGE/PERFORMANCE —**

### **1. OUTLINE OF DIAGNOSIS**

Judge NG when the turbine speed signal is not transmitted for some reasons.

### **2. COMPONENT DESCRIPTION**

Torque converter turbine speed sensor (output shaft speed sensor) is installed to the outside of transmission case.

This sensor detects the turbine speed of torque converter by the peripheral speed of high clutch drum connected to input shaft. And then it transmits the sine wave signal (32 pulses per rev.) to TCM. TCM calculates the ratio of the input shaft speed to vehicle speed, and then makes a judgment whether to shift or not.

## GENERAL DESCRIPTION

### DA:DTC P1448 — FUEL TANK SENSOR CONTROL VALVE RANGE/PERFORMANCE —

#### 1. OUTLINE OF DIAGNOSIS

Detect the tank pressure switching solenoid function abnormality.

The tank pressure sensor is a relative pressure sensor, which normally compares the pressure with the atmospheric pressure. The tank pressure switching solenoid is a solenoid, which shifts the compare space from opening to closed during the EVAP diagnosis. Detect the malfunction that the compare space remains closed. (Not judge NG after enable condition completed but assume NG before enable condition completed.)

#### • Normality Judgment

Judge OK when the fuel tank pressure does not change (or changes by less than 0.67 kPa (5 mmHg, 0.2 inHg) at atmospheric pressure changing by 0.67 kPa (5 mmHg, 0.2 inHg) or more per 80 seconds.

- (A) Enable conditions are completed.
- (B) 80 s
- (C) Pressure
- (D) Atmospheric pressure
- (E) Tank pressure
- (F) PCV function reduces the tank pressure.

- (G) Judge OK when the tank pressure does not change.
- (H) The tank pressure is relative pressure against atmospheric pressure.
- (I) Atmospheric pressure is absolute pressure.

# DIAGNOSTIC TROUBLE CODE (DTC) DETECTING CRITERIA

GENERAL DESCRIPTION

## • Abnormality Judgment

Judge NG temporarily when the fuel tank pressure changes by 0.67 kPa (5 mmHg, 0.2 inHg) or more at atmospheric pressure changing by 0.67 kPa (5 mmHg, 0.2 inHg) or more per 80 seconds, and then judge NG when the previous condition is completed 5 times in a row.

- (C) Pressure
- (D) Atmospheric pressure
- (E) Tank pressure
- (F) Judge NG temporarily the tank pressure changes once, and then judge NG the tank pressure changes five times in a row.

Judge NG when the malfunction criteria below are completed after 300 seconds have passed continuously.

### Judgment Value

Malfunction Criteria	Threshold Value
$\text{sumdelo2} = \text{sumdelo2} + (\text{rvo2} - \text{rsl})$ where: rvo2 = sensing voltage of secondary oxygen sensor rsl = target voltage of secondary oxygen sensor	> -16740 V

**Time Needed for Diagnosis:** 300 seconds

**Malfunction Indicator Light Illumination:** Illuminates when malfunction occurs in 2 continuous driving cycles.

### • Normality Judgment

Judge OK and clear the NG when the rear oxygen output is reversed, and during 4 seconds after that, the sub feedback control amount does not stick to rich or lean sides.

## 6. DTC CLEAR CONDITION

- When the OK idling cycle was completed 40 times in a row
- When "Clear Memory" was performed

## 7. MALFUNCTION INDICATOR LIGHT CLEAR CONDITION

- When the OK driving cycle was completed 3 times in a row
- When "Clear Memory" was performed

## 8. FAIL SAFE

None

## 9. ECM OPERATION AT DTC SETTING

Memorize the freeze frame data. (For test mode \$02)

## GENERAL DESCRIPTION

### DZ:DTC P2097 — POST CATALYST FUEL TRIM SYSTEM TOO RICH BANK 1 —

#### 1. OUTLINE OF DIAGNOSIS

Detect the malfunction of fuel system from the amount of sub feedback control.

Judge NG when the rear oxygen sensor output does not approach to the slice level (target voltage) with the control amount sticks to rich or lean side while operating the sub feedback control.

#### 2. COMPONENT DESCRIPTION

- (1) Atmosphere
- (2) Exhaust gas
- (3) Electromotive force

- (A) Electromotive force
- (B) Air fuel ratio
- (C) Lean
- (D) Rich
- (E) Theoretical air fuel ratio
- (F) Comparative voltage

#### 3. ENABLE CONDITION

Secondary Parameters	Enable Conditions
Fuel system monitoring with primary oxygen sensor	In operation
Target lambda with primary oxygen sensor	1.0
Closed loop control with secondary oxygen sensor	In operation
Amount of intake air	$\geq 20$ kg/h
Feed back control with secondary oxygen sensor	Reached to the limit value

#### 4. GENERAL DRIVING CYCLE

Perform the diagnosis continuously at a constant 20 km/h (12 MPH) or more.
